# Motivation

# Observation 1

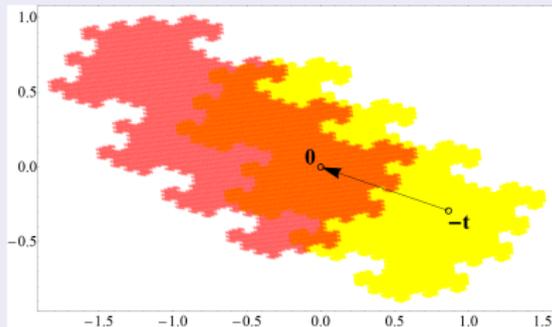

## Congruence

The Rauzy fractals induced by the substitutions

$$\sigma : 1 \mapsto 1211, 2 \mapsto 311, 3 \mapsto 1 \text{ and}$$

$$\sigma' : 1 \mapsto 1112, 2 \mapsto 113, 3 \mapsto 1$$

over the alphabet  $\mathcal{A} = \{1, 2, 3\}$  are congruent (that is they differ by an affine transformation only).

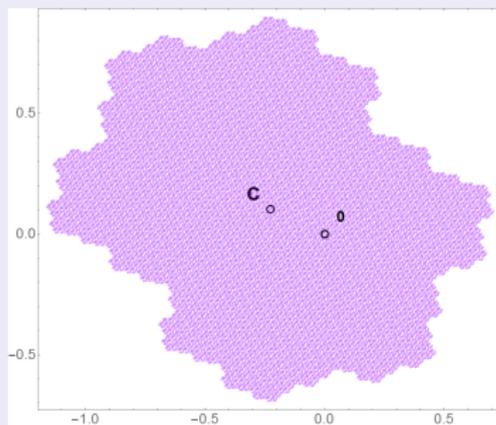

# Observation 2

Symmetry (Sellami, Sirvent: 2011, 2012, 2016)

The (original) Rauzy fractal induced by the substitutions

$$\sigma : 1 \mapsto 12, 2 \mapsto 13, 3 \mapsto 1$$

(over the alphabet  $\mathcal{A} = \{1, 2, 3\}$ ) is central-symmetric with respect to some point  $\mathbf{c}$ .

## Notations

We denote

$\mathcal{A}$  finite set (alphabet) (here  $\mathcal{A} = \{1, 2, \dots, m\}$ )

$\mathcal{A}^*$  set of finite words over  $\mathcal{A}$

$\varepsilon$  empty word

$\tilde{X}$  mirror-word of  $X \in \mathcal{A}^*$

$|X|_y$  number of occurrences of the letter  $y \in \mathcal{A}$  within the word  $X \in \mathcal{A}^*$

$I(X)$  “Abelianisation” of  $X \in \mathcal{A}^*$ , *i.e.*

$I(X) = (|X|_1, \dots, |X|_m) \in \mathbb{Z}^m$

# Some linear algebra

## Substitution and induced subspaces

Let  $\sigma$  be a primitive unimodular Pisot substitution over  $\mathcal{A}$ , i.e. an endomorphism  $\mathcal{A}^* \rightarrow \mathcal{A}^*$  such that

$\mathbf{M}_\sigma := (|\sigma(x)|_y)_{1 \leq x, y \leq m}$  is a primitive matrix; the dominant real eigenvalue  $\theta > 1$  of  $\mathbf{M}_\sigma$  is a Pisot unit. Let  $d + 1$  be the algebraic degree of  $\theta$ . If  $d + 1 = m$  then  $\sigma$  is irreducible. We define

$E^u$  subspace spanned by the right eigenvector associated with  $\theta$  ( $E^u \cong \mathbb{R}$ ).

$E^s$  subspace spanned by the right eigenvectors associated with the Galois conjugates different from  $\theta$  ( $E^s \cong \mathbb{R}^d$ ).

$E^c$  subspace spanned by the right eigenvectors associated with the remaining eigenvalues ( $E^c \cong \mathbb{R}^{m-d-1}$ ).

$\pi$  projection of  $\mathbb{R}^m$  onto  $E^s$  (along  $E^u$  and  $E^c$ )

Problems

## Definition

Two substitutions  $\sigma, \sigma'$  over  $\mathcal{A}$  are *conjugated* (written  $\sigma \sim \sigma'$ ) if there exists a word  $X \in \mathcal{A}^*$  such that for each  $y \in \mathcal{A}$  we have  $X\sigma(y) = \sigma'(y)X$  (or for each  $y \in \mathcal{A}$  we have  $\sigma(y)X = X\sigma'(y)$ ).

## Lemma

If two substitutions  $\sigma, \sigma'$  over  $\mathcal{A}$  are *conjugated* then  $\mathfrak{L}_\sigma = \mathfrak{L}_{\sigma'}$  and  $\mathbf{M}_\sigma = \mathbf{M}_{\sigma'}$ .

# Conjugacy

## Definition

Two substitutions  $\sigma, \sigma'$  over  $\mathcal{A}$  are *conjugated* (written  $\sigma \sim \sigma'$ ) if there exists a word  $X \in \mathcal{A}^*$  such that for each  $y \in \mathcal{A}$  we have  $X\sigma(y) = \sigma'(y)X$  (or for each  $y \in \mathcal{A}$  we have  $\sigma(y)X = X\sigma'(y)$ ).

## Lemma

If two substitutions  $\sigma, \sigma'$  over  $\mathcal{A}$  are *conjugated* then  $\mathfrak{L}_\sigma = \mathfrak{L}_{\sigma'}$  and  $\mathbf{M}_\sigma = \mathbf{M}_{\sigma'}$ .

## Theorem

Suppose that  $\sigma \sim \sigma'$  such that  $X\sigma(y) = \sigma'(y)X$  holds for all  $y \in \mathcal{A}$ . Then  $\mathcal{R}_{\sigma'} = \mathcal{R}_\sigma + \mathbf{t}$  with  $\mathbf{t} = \sum_{n \geq 0} f^n \circ \pi \circ \mathbf{l}(X) \in E^S$ , where  $f$  is the restriction of the action of  $\mathbf{M}_\sigma$  on  $E^S$  (especially,  $f$  is a contraction).

# Example

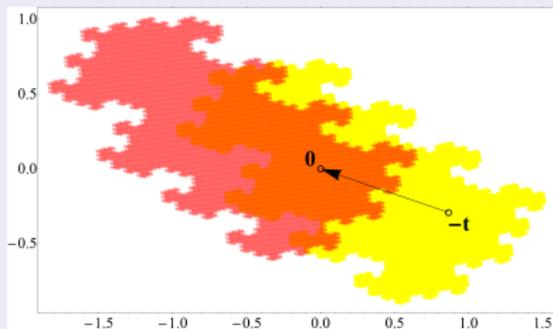

## Our initial example

The Rauzy fractals induced by the substitutions

$$\sigma : 1 \mapsto 1211, 2 \mapsto 311, 3 \mapsto 1 \text{ and}$$

$$\sigma' : 1 \mapsto 1112, 2 \mapsto 113, 3 \mapsto 1$$

over the alphabet  $\mathcal{A} = \{1, 2, 3\}$  differ by a translation only since  $\sigma \sim \sigma'$  (we have  $11\sigma(y) = \sigma'(y)11$  for all  $y \in \mathcal{A}$ ). We can easily calculate the translation vector  $\mathbf{t}$ .

## Theorem

Let  $\sigma$  be a primitive unimodular Pisot substitution such that  $\sigma(y)X = X\tilde{\sigma}(y)$  holds for all  $y \in \mathcal{A}$ . Then the Rauzy fractal  $\mathcal{R}_\sigma$  is central symmetric with respect to  $\mathbf{c} := \frac{1}{2} \sum_{n \geq 0} f^n \circ \pi \circ \mathbf{l}(X)$ .

# Arnoux-Rauzy substitutions

## Definition

Let

$$\sigma_1 : 1 \mapsto 1, 2 \mapsto 12, 3 \mapsto 13$$

$$\sigma_2 : 1 \mapsto 21, 2 \mapsto 2, 3 \mapsto 23$$

$$\sigma_3 : 1 \mapsto 31, 2 \mapsto 32, 3 \mapsto 3.$$

Each composition that includes  $\sigma_1$ ,  $\sigma_2$  and  $\sigma_3$  at least once is a primitive, irreducible, unimodular Pisot substitution.

# Arnoux-Rauzy substitutions

Symmetric  
Rauzy  
fractals

Paul Surer

Motivation

Construction

Congruence

Symmetry

Problems

## Definition

Let

$$\sigma_1 : 1 \mapsto 1, 2 \mapsto 12, 3 \mapsto 13$$

$$\sigma_2 : 1 \mapsto 21, 2 \mapsto 2, 3 \mapsto 23$$

$$\sigma_3 : 1 \mapsto 31, 2 \mapsto 32, 3 \mapsto 3.$$

Each composition that includes  $\sigma_1$ ,  $\sigma_2$  and  $\sigma_3$  at least once is a primitive, irreducible, unimodular Pisot substitution.

## Theorem

If  $\sigma = \sigma_{i_1} \circ \cdots \circ \sigma_{i_n}$  then  $\sigma(y)X = X\tilde{\sigma}(y)$  for all  $y \in \{1, 2, 3\}$  with

$$X = \sigma_{i_1}(\sigma_{i_2}(\sigma_{i_3}(\cdots (\sigma_{i_{n-1}}(i_n)i_{n-1}) \cdots )i_3)i_2)i_1.$$

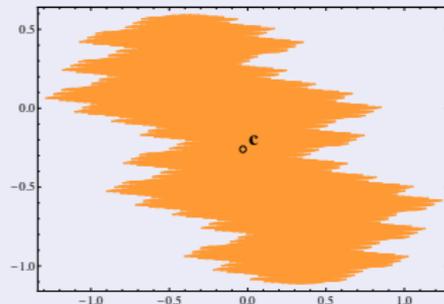

# Example

## A specific Arnoux-Rauzy substitution

Let  $\sigma = \sigma_2 \circ \sigma_1 \circ \sigma_2 \circ \sigma_2 \circ \sigma_3$ . Then for each  $y \in \{1, 2, 3\}$  we have  $\sigma(y)X = X\tilde{\sigma}(y)$  with

$$X = \sigma_2(\sigma_1(\sigma_2(\sigma_2(3)2)2)1)2 = 2122122123212212212.$$

Therefore,  $\mathcal{R}_\sigma$  is central symmetric with respect to  $\mathbf{c} := \frac{1}{2} \sum_{n \geq 0} f^n \circ \pi \circ \mathbf{l}(X)$ .
